

P-1 Safety Function

The P-1 comes with a safety function, which is activated by placing a magnet over the display of the fixture. By doing so, all the output and display features are instantly disabled, and only charging is possible.

This safety function is intended for transport in flight cases, ensuring that the battery will not discharge during transport or storage.

The magnet must be placed within a certain distance from the display (max. 25mm), and in the area between the 'ESC' key and the display.

The magnet is included when acquiring a P-1, and it is also available through your SGM dealer.

The SGM P-1 flight cases has a proper slot for the magnet in the SIP inlay, located on the side where the display will be touching while stored. For safety and warranty reasons, it is highly recommended to adapt this function to the P-1 custom-made flight cases.
